

Liebherr Reman Program - a new life for components

With its remanufacturing program ("Reman" for short), Liebherr provides economical maintenance solutions for the entire European market. There are three coordinated Reman levels in order to meet all customer requirements in terms of availability, budget and intensity of use. In France, Liebherr Reman solutions are offered via the official Liebherr dealer network throughout the country.

As compared to the production of new components, remanufacturing results in an average energy saving of 70 % as well as the possibility to reuse up to 75 % of the existing material. This avoids unnecessary waste of natural resources and significantly reduces the environmental impact.

At Intermat 2018, Liebherr presents its Reman Program on the example of a cross-sectional model of a V12 diesel engine.
