

### **Versatile and compact: Liebherr solutions in operation at Montagnier TP**

- Two compact Liebherr machines in use since 2017
- Comprehensive solutions thanks to machine, hydraulic changer and tools
- Family-run company Montagnier TP a Liebherr customer for around 30 years

**Colmar (France), 12 June 2019 – In 2017, Montagnier TP expanded its fleet with two new compact Liebherr machines: the A 914 Compact wheeled excavator and the R 914 Compact crawler excavator. These excavators are still very efficient and powerful after two years in operation and are characterised by optimal use of Liebherr's LIKUFIX® system and tilt rotator. These solutions, developed by Liebherr, enable both enhanced machine versatility and a particularly compact design.**

In 2017, Montagnier TP purchased two compact Liebherr machines in response to the increasingly confined conditions on construction sites. Key factors in the purchasing decision included exceptional cooperation with local Liebherr sales partner Tecmat Service and the fact that Liebherr has exclusively developed all elements of the complete solution.

Both the A 914 Compact wheeled excavator and the R 914 Compact crawler excavator are still being used successfully at Montagnier TP for operations such as sewage and drainage work or smaller earthmoving work. Thanks to the compact design, these machines only need one track on construction site transport routes.

With 1,300 operating hours for each machine per year, the low consumption of these excavators is welcomed by the family-run company: 6.7 l/h for the R 914 Compact and 6.2 l/h for the A 914 Compact.

#### **Complete solution from Liebherr: machine, changing devices, tools**

The A 914 Compact and R 914 Compact machines are equipped with Liebherr's LIKUFIX® system and the tilt rotator. In addition to the compact design and high

performance levels of these machines, other deciding factors for Montagnier TP included having one source for the complete solution, including changing devices and tools.

The tilt rotators enable even more versatile and flexible use of backhoe buckets, making time-consuming repositioning of the machines during work unnecessary. The result is a noticeable increase in productivity on the construction sites. The Liebherr tilt rotators have a swing angle of 2 x 50° and can endlessly rotate through 360°. Even at maximum swivelling, the horizontal tilt cylinder has no protruding parts that could be damaged during use within confined areas. This guarantees low maintenance costs for this tool, which is ideal for support work or applications close to buildings.

The LIKUFIX® system is a hydraulic quick coupler combined with an automatic hydraulic coupling system specially developed by Liebherr. It allows mechanical and hydraulic tool attachments to be quickly and safely changed from inside the operator's cab.

This combination is ideal for Montagnier TP, which has to change tools up to 25 times a day per machine on certain construction sites. Company employees unanimously agreed on both the LIKUFIX® system and the tilt rotator.

### **Family-run Montagnier TP**

Montagnier TP was founded in 1976 by the Montagnier family. The company's first Liebherr machine, an R 932, was purchased in the 1990s. The registered office is located in Pélussin in the Pilat Natural Regional Park. Apart from the head office, two recycling plants are also in operation: one also in Pélussin and the other in Saint-Chamond.

The company currently has 25 employees divided into six teams. They are mainly deployed for sewage and drainage work, earthmoving, demolition works, track construction and in recycling. In 2014, second generation family member Mathieu Montagnier took over the running of the company.

### **Captions**
